

90-DAY PILOT PROPOSAL

MAKE THE DOORKING GATE SMARTER WITHOUT REPLACING THE BOX.

Angel Gates runs beside the existing metal DoorKing call box as a premium add-on asset: visitor passes, faster entry, timestamps, camera evidence, and property-manager incident delivery — and it keeps working even when the internet is down.

STAYS

DoorKing remains the foundation.

ADDS

QR/PIN passes using existing camera evidence.

DELIVERS

Timestamped incident emails.

Open the live interactive proposal.

Point a phone camera at the code to open the full Angel Gates proposal in a browser: the benefit flip cards, the six-step visitor flow, and the incident-email mockup. Easy to forward straight to the property owner.

dacameragirl.github.io/angel-gates/proposal.html

A cleaner gate experience with better accountability.

The current Doorking setup remains in place. Angel Gates is a value-add asset beside it, giving residents and managers a modern way to send time-limited QR/PIN passes to guests, deliveries, cleaners, vendors, contractors, and family.

The point is faster gate flow on normal days and better evidence on bad days. When something goes wrong, the property gets a timestamped event that can

be matched to camera footage and delivered to the property manager for review.

WHO SHOWS UP AT THE GATE

Built for the daily delivery rush.

A modern community gets a constant stream of drivers and visitors who need in once, on time, without a permanent code that never goes away. Angel Gates issues a time-limited pass for any of them:

GUESTS & FAMILY

CURRENT PAIN

The old metal box stays, but it should not be the only visitor workflow.

Loud failed-code lines

Guests mistype codes, the keypad beeps, and the lane backs up while everyone waits.

Shared code abuse

Permanent gate codes spread because short-term access is not easy enough.

Manual incident review

Managers have video in one place, access context somewhere else, and no clean timeline.

Unauthorized entry attempts

One vehicle can try to sneak in behind another, leaving the manager to hunt through video later.

Weak chargeback evidence

Gate-arm damage becomes a property expense when the responsible event is hard to prove.

WHY THEY WANT IT

Benefits by audience

RESIDENTS

Send a pass before the visitor arrives.

Cleaner access without handing out a permanent gate code.

VISITORS

Use the approved pass, not the old keypad routine.

Fewer stuck cars and faster movement through the lane.

MANAGERS

Know who, when, and why.

Pass control, denied attempts, and incident context in one place.

OWNERSHIP

Pilot value before rollout.

Better access and evidence without replacing DoorKing.

Six steps from pass to proof

1

Create

A resident or manager creates a pass in seconds for a specific guest, vendor, delivery, or contractor — no permanent gate code handed out, and no call to the office.

2

Limit

Each pass is locked to one gate and sponsor with an exact start time, expiration, and optional use limit, issued as a signed QR code or PIN that cannot be forged or quietly shared.

3

Send

The visitor gets the pass on their phone before they arrive — no app to download, and no hunting the resident directory at the call box.

4

Scan

At the gate the visitor scans the QR or types the PIN at the Angel Gates reader — a small scanner and keypad mounted at car-window height, beside (not replacing) the old DoorKing box.

5

Open

The Angel Gates edge controller (the hidden Pi brain in the cabinet) verifies the pass locally in under a second and pulses the gate open. It works even with no internet, and a wrong, expired, or revoked pass is denied and logged.

6

Review

Every attempt — allowed or denied — is written to a tamper-evident log with timestamp, credential, and sponsor, so any incident ties back to the exact gate event and camera clip.

Every incident becomes a timestamped manager email.

Angel Gates can use the property's existing camera or NVR if it provides an approved stream, snapshot, or clip export. If the existing camera already sees the gate arm and vehicle area, Angel Gates can use that as the evidence source. The system packages the time, gate event, credential, sponsor, vehicle/tag reference, and camera clip into a manager-ready review email for damage, possible unauthorized entry, denied access, or other incidents.

DoorKing stays

The existing metal box, keypad, gate operator, free-exit behavior, and safety devices remain the foundation.

Angel Gates adds

A premium access-and-evidence asset: edge controller, QR/PIN reader, local event log, camera evidence links, and manager email workflow. It decides locally, so the gate keeps working even when the property internet or cloud is down.

Installer boundary

A qualified gate/access installer connects the add-on path without modifying safety equipment.

PILOT SCOPE

90 days, one gate, measurable value.

- Existing DoorKing setup remains in place.
- QR/PIN access for selected residents, visitors, vendors, and managers.
- Faster visitor flow compared with the old call-box/keypad routine.
- Existing camera/NVR used as the evidence source if accessible.
- Local edge authorization keeps the gate working without internet; events queue and sync when the connection returns.
- Incident email alerts for gate damage, possible unauthorized entry, and denied access.
- No DoorKing replacement and no gate safety modification.

AFTER PILOT

\$279/month

**Example for one gate and
270 units.**

HARDWARE KIT

\$499 one-time

INSTALL/SETUP

\$350 one-time

SERVICE

\$79/gate + \$0.75/unit
